

Firm Pay, Amenities, and Inequality

Sydnee Caldwell
UC Berkeley & NBER

Ingrid Haegele
LMU & IAB

Joerg Heining
IAB

NBER Summer Institute 2025

Introduction

- ▶ Firms differ in pay and non-pay factors
- ▶ A large literature studies how **pay** varies across firms
- ▶ Difficult to isolate pay and non-pay components
 - ▶ Well-known that regressions of pay on characteristics yield “wrong-signed” estimates
 - ▶ Flow-based or structural methods rely on assumptions about offer rates
 - ▶ Firms care about the preferences of the marginal worker
- ▶ Growing literature has documented that workers value **specific amenities** a lot
 - ▶ Not clear how the overall bundle relates to wages, wage premia

This Paper

1. How do firms vary in the value of amenities?

- ▶ Field a large-scale survey to full-time German workers between the ages of 25 and 50
- ▶ Ask these workers where they would apply if they wanted to switch firms
- ▶ Use firm-specific discrete choice experiments to estimate overall value of firm amenities

2. Do valuations vary across workers?

- ▶ Examine heterogeneity in valuations by sex and education
- ▶ Correlate amenity values with observed characteristics

3. How do non-wage values shape job-to-job mobility and inequality?

- ▶ Link amenity values to firm wage premia and overall inequality
- ▶ Link mobility to firm wage and amenity values
- ▶ Examine implications for sorting and the gender (wage, amenity, value) gap

Data

Survey and Administrative Data

Survey of full-time German workers between 25 and 50 (Caldwell et al. 2025)

- ▶ Elicited the names of specific firms workers would want to move to
- ▶ Asked workers to compare hypothetical offers from these firms under researcher-randomized raises

IAB Social Security records

- ▶ Worker histories, occupation and industry codes, AKM effects (Bellmann et al., 2020)
- ▶ Full time workers between the ages of 25 and 50
- ▶ 3 samples: surveyed workers, 2010-2019 movers, random sample

Firm reviews and rankings from Kununu

- ▶ Worker-provided information on what amenities are offered
- ▶ Workers' ratings (overall and in various categories) of firms
- ▶ Worker-provided reviews of firms (free-text)

Descriptive Statistics

Conceptual Framework

A Simple Model of Workers' Utility

$$u_{ij} = \log w_{ij} + a_j + \epsilon_{ij}$$

Assuming $\epsilon \sim EV1$, the share of workers who choose k over j is

$$P(\text{choose } k \text{ over } j) = \mathbb{E} \left[\frac{\exp(\log w_{ik} + a_k)}{\exp(\log w_{ik} + a_k) + \exp(\log w_{ij} + a_j)} \right]$$

Economic and Econometric Issues:

- ▶ Endogeneity of wages
- ▶ Observed flows depend on both preferences and offer rates
- ▶ Preferences of the marginal worker matter, but movers are on one side of the margin
- ▶ Static vs. dynamic considerations

Design Choices

What Workers Evaluating What Firms?

- ▶ Full-time workers between the ages of 25 and 50
- ▶ Evaluating firms they are potentially interested in moving to
 - ▶ Mover sample has [negative bias in correlation with wages](#) (Bonhomme and Jolivet, 2009)
- ▶ Valuations differ between firm insiders and outsiders (Caldwell et al., 2025)
 - ▶ Focus on valuations of firm outsiders for consistency

How to Elicit Valuations

- ▶ Hypothetical choice experiments (Mas, 2025; Maestas et al., 2023)
- ▶ Isolate dynamic considerations by asking workers to re-rank firms
- ▶ Interpret regressions of values on specific amenities as correlational

Identifying a_j Using Hypothetical Choice Experiments

“Suppose you planned to move to a new company in the next {one/three/six} months. What are companies that you would consider applying to?

Please list three companies that you would consider applying to and that hire employees in positions like yours (e.g. “Placeholder Inc”). These can be companies without current job vacancies.”

[Fill in Company 1]

[Fill in Company 2]

[Fill in Company 3]

☐ I do not want to answer this question

Identifying a_j Using Hypothetical Choice Experiments

“Suppose you planned to move to a new company in the next {one/three/six} months. What are companies that you would consider applying to?

Please list three companies that you would consider applying to and that hire employees in positions like yours (e.g. “Placeholder Inc”). These can be companies without current job vacancies.”

[Fill in Company 1]  {Company 1} with a X% raise _____

[Fill in Company 2]  {Company 2} with a Y% raise _____

[Fill in Company 3]  {Company 3} with a Z% raise _____

☐ I do not want to answer this question

Suppose you can remain at your current company or switch to any of the companies listed below and immediately receive the raise specified.

Please rank the following job offers from 1 to 4 where 1 is the offer you are most likely to take and 4 is the offer you are least likely to take.

Remain at current firm at current pay _____

Identifying a_j Using Hypothetical Choice Experiments

“Suppose you planned to move to a new company in the next {one/three/six} months. What are companies that you would consider applying to?

Please list three companies that you would consider applying to and that hire employees in positions like yours (e.g. “Placeholder Inc”). These can be companies without current job vacancies.”

[Fill in Company 1] _____ → {Company 1} with a X% raise _____

[Fill in Company 2] _____ → {Company 2} with a Y% raise _____

[Fill in Company 3] _____ → {Company 3} with a Z% raise _____

☐ I do not want to answer this question

Suppose you can remain at your current company or switch to any of the companies listed below and immediately receive the raise specified.

Please rank the following job offers from 1 to 4 where 1 is the offer you are most likely to take and 4 is the offer you are least likely to take.

~~Remain at current firm at current pay~~ _____

Estimating Valuations from DCEs

Prefer firm j to firm k if

$$r_j + \log w_i + a_j + \epsilon_{ij} > r_k + \log w_i + a_k + \epsilon_{ik}$$

Sample: use workers' preferences over outside firms

- ▶ 3 bilateral comparisons per worker

For each pair j, k we calculate P_{jk} , the share of workers who pick firm j over firm k

- ▶ Follow Sorkin (2018) to use this empirical matrix to recover valuations 
- ▶ Randomization of raises allows us to directly identify a_j (rather than $\log w_j + a_j$)

Estimates directly identify the money-metric value of amenities a_j

- ▶ For firms in the strongly connected set
- ▶ Up to a normalization (selected to be around the median)

Ranked Firms

Workers provide a large number of distinct firms ▶ Number ▶ Characteristics

- ▶ Which previous workers from their firm have moved to ▶
 - ▶ Industry
 - ▶ Size
- ▶ Which are “reasonable” in terms of wages ▶

Trade-offs are not just about wages

- ▶ Only 60-70% of workers pick the higher wage firm when the randomized wage gap is $<10\%$
- ▶ 90% prefer the higher wage firm when the gap is 15%

Heterogeneity and Predictors

Distribution of Raw Valuations (Money-Metric)

Valuations Predict Size and Quit Rates

Amenity valuations

- ▶ Are positively correlated with other firm rankings (e.g. poaching rank, Kununu % recommend) 
- ▶ Are predictive of size, conditional on wage 
- ▶ Are somewhat predictive of quit rates, conditional on wages 

Estimates do not Simply Reflect Dynamic Considerations

There is Disagreement in Valuations!

	Baseline	Female	Male	College Degree	No College Degree
	(1)	(2)	(3)	(4)	(5)
Baseline	1	0.551	0.829	0.801	0.649
Female	0.388	1	0.177	0.470	0.444
Male	0.805	0.0703	1	0.698	0.548
College Degree	0.732	0.422	0.663	1	0.249
No College Degree	0.463	0.389	0.391	0.0601	1

Below the diagonal: Pearson correlation. Above the diagonal: Spearman rank correlation.

Implications

Implications

1. Amenities do not offset inequality in firm wage premia $\hookrightarrow$
2. But they do help explain why workers take wage cuts $\hookrightarrow$
3. And they offset some of the sorting-induced gender wage gap $\hookrightarrow$

1. Amenities Do Not Offset Wage Variation for the Average Firm

Note: use split-sample approach to account for measurement error in amenity valuations.

► Raw Binscatter

1. Amenities Do Not Offset Wage Variation for the Average Worker

Note: use split-sample approach to account for measurement error in amenity valuations.

► Raw Binscatter

2. But They Do Help Explain Why Workers Take Wage Cuts

	Change in Amenities			Total
	>2% Cut	<2% Change	>2% Raise	
	(1)	(2)	(3)	(4)
A. Change in Own Wage				
>2% Cut	1.9%	19.9%	1.5%	23.3%
<2% Change	1.9%	32.2%	1.6%	35.7%
>2% Raise	4.9%	31.8%	4.3%	41.0%
Total	8.7%	84.0%	7.4%	100.0%
B. Change in Firm Wage Premium				
>2% Cut	3.7%	1.6%	3.5%	8.8%
<2% Change	0.4%	80.9%	0.3%	81.7%
>2% Raise	4.7%	1.2%	3.7%	9.5%
Total	8.8%	83.7%	7.5%	100.0%

3. And They Offset Some of the Sorting-Induced Gender Gap

	Baseline Valuations			Sex-Specific Valuations		
	(1)	(2)	(3)	(4)	(5)	(6)
A. Firm Wage Premium						
Female	-0.011*** (0.000) 509958	-0.011*** (0.000) 509958	-0.002*** (0.000) 509954	-0.016*** (0.000) 484921	-0.016*** (0.000) 484921	-0.007*** (0.000) 484917
B. Amenity Value

Occupation FE			X			X

Conclusion

- ▶ Use discrete choice experiments, embedded in a large-scale survey, to estimate money-metric valuations of amenities for marginal workers
- ▶ Amenity valuations are both highly dispersed and heterogeneous
- ▶ Do not find that amenity provision offsets heterogeneity in wages (or dampens overall inequality)
 - ▶ Close to zero correlation with firm wage premia
- ▶ Women place more value on non-wage characteristics than men
 - ▶ Gender wage gap in total values is smaller than gap in firm wage premia

Workers Provide Many Distinct Firms

- ▶ Worker-provided firms span a broad range of the German labor market
 - ▶ Total employment in Germany > 6.2 million.
 - ▶ Received more than 190 million page views on employer rating platform Kununu.
- ▶ Nearly 3000 distinct firms—of varying sizes—are mentioned
 - ▶ Ex: local municipal utility, small manufacturer of agricultural equipment, glass producer

Why Not Movers?

[▶ Back](#)

- ▶ Workers at low-wage firms are more likely to be selected on having high amenity valuations than workers at high-wage firms within a given labor market.
- ▶ The bias can be large under reasonable parameterizations (see simulation below)

Estimation of Firm Valuations 1/2 [▶ Back](#)

Person i 's hypothetical value of working at firm j is:

$$u_{ij} = r_{ij} + \log w_i + a_j + \epsilon_{ij}$$

The probability of ranking firm k above firm j is

$$P_{kj} = \mathbb{E}_{j,k} \left[\frac{\exp(r_{ik} + a_k)}{\exp(r_{ik} + a_k) + \exp(r_{ij} + a_j)} \right].$$

Let $\mathbf{x}$ solve the linear problem from Sorkin (2018)

$$x_k = \frac{\sum_j P_{kj} x_j}{\sum_j P_{jk}}.$$

Define a bias term ξ_k where

$$x_k \propto \exp(a_k + \xi_k).$$

Estimation of Firm Valuations 2/2

[▶ Back](#)

Then

$$\frac{\exp(\xi_k)}{\exp(\xi_j)} = \frac{\mathbb{E}_{j,k} \left[\frac{\exp(r_{ik})}{\exp(r_{ik}+a_k)+\exp(r_{ij}+a_j)} \right]}{\mathbb{E}_{j,k} \left[\frac{\exp(r_{ij})}{\exp(r_{ik}+a_k)+\exp(r_{ij}+a_j)} \right]}.$$

The first order expansion of $\mathbb{E}[\frac{X}{Y}]$ around $\mathbb{E}[X]$ and $\mathbb{E}[Y]$ is $\mathbb{E}[\frac{X}{Y}] \approx \frac{\mathbb{E}[X]}{\mathbb{E}[Y]}$. Therefore,

$$\frac{\exp(\xi_k)}{\exp(\xi_j)} \approx \frac{\mathbb{E}_k [\exp(r_{ik})]}{\mathbb{E}_j [\exp(r_{ij})]} = 1$$

because r_{ik} is randomly assigned. Therefore,

$$x_k \propto \exp(a_k)$$

$$\log(x_k) \approx a_k + c$$

for some constant c . So,

$$\log(x_k) - \log(x_j) \approx a_k - a_j.$$
